

## *IV Transfer System*

- Transfer IV pole with mounted infusion pumps using the power of the bed
- Patented automatic safety lock ensures TAD is securely locked to the adapter
- Move IV pole between headwall, boom, bed and mobile docking station without manual lifting or disconnecting infusion pumps
- Transfer takes 15 seconds, one person operation
- Keeps the floor clear reducing adverse events during patient transport
- Essential equipment stays close to the patient

# Trust TAD™

Safe. Secure. Seamless. Patient Transfer.

# Adverse events occur in *up to 70%* of patient transports. *Reduce risk and improve safety* with the Nexxspan TAD™.

## Nexxspan TAD™

The Nexxspan TAD™ IV Transfer System enables safe movement of infusion and other pole mounted equipment from a stationary position on a wall or boom to a hospital bed, and *vice versa*. The TAD™ system consists of three primary components: a transfer device with IV pole, a bed adapter, and a headwall or boom adapter.

TAD™ features a patented safety interlock that automatically locks onto a target cone and simultaneously releases from the delivery cone. By automating the critical task of locking and unlocking the device during transfer, safety and staff efficiency are greatly enhanced. Eliminating the need for manual lifting of equipment by clinicians ensures staff injuries and worker compensation claims are avoided.

## Safe

- Eliminates IV floor stands to minimize trip hazards
- Reduces accidental IV lead disengagement
- Entire system rotates parallel to patient's head to make moving down hallways and into and out of elevators safe

## Secure

- Patented, automatic locking mechanism ensures stable, secure connection
- Reduces human error because locking/ unlocking during transfer is automatic: no need to remember setting or opening locks and abates the dangers of forgetting these tasks

## Seamless

- Efficient operation by just one person streamlines size of transport team
- Eliminates stressful and time-wasting process of lifting and moving IV pump from wall to bed, reducing nurse injury

To transfer IV pole, pumps and equipment from boom to hospital bed, position TAD™ over the bed receiver.

Press UP on the hospital bed and TAD™ automatically locks on the bed arm adapter and disengages from the boom arm adapter.

Rotate TAD™ within the footprint of the bed and transport patient with all critical IV pumps and equipment.

TAD™ can be docked on any boom or the optional mobile docking station by simply reversing the process. Press DOWN on the hospital bed until TAD™ is fully engaged and free from the bed arm.

**TAD™ IV Transfer System**

1035-202

Part Number	Description
1035-202	IV Transfer Device with Dual IV Rack, 19" Long extends to 29" with 4 Hook Hanger on each Pole
1035-205	Mobile Docking Station
1035-207	Mount for 38mm pole with Arm and Cone (Call for other available mounting methods)
1035-210	Mount for Wall with Arm and Cone (must purchase 1035-P41)
1035-XXX	Bed Arm for a wide range of beds available. (Call for more information on your bed adapter.)
1035-P41	Backer Box Assembly for TAD Boom Arm & Wall Mount
